

ArrayUnshift Method:

Definition and Usage:

The **unshift()** method adds new elements to **the beginning** of an array.

The **unshift()** method overwrites the original array.

```
Day5 > ArrayUnshift > arrayunshift.html > body
1  <!-- How to use Array unshift() method in JavaScript?
2
3  JavaScript provides unshift() method to add elements to the beginning of an array.
4  You can even add multiple elements and array to the beginning of the array using unshift() method. -->
5
6  <!-- Note: unshift() method modifies the original array and returns the length of the updated array. -->
7
8
9  <!DOCTYPE html>
10 <html>
11
12 <body>
13
14   <h2>JavaScript Array unshift</h2>
15
16   <script>
17
18     let vegetables = ["Potato", "Tomato", "Cabbage"];
19     vegetables.unshift("Broccoli");
20     console.log(vegetables);
21
22   </script>
23
24 </body>
25
26 </html>
```

Output:
